

## Pro Series Turbine Cleaning Tips

### System Turbine Unit

The air intake vent **MUST** be cleaned weekly to avoid any build-up of foreign material/hair/dust as this may constrict the air flow and effect the atomization of your applicator.

An obstructed vent will make your applicator spit or have a spotting effect on your clients when spraying.

**PLEASE DISCONNECT THE POWER CORD FROM THE UNIT BEFORE CLEANING.**

**DO NOT OPERATE TURBINE ON CARPET OR SIMILAR FLOORING**

See examples below of not cleaning the vent correctly and a clean base.

### Applicator Hose

Please inspect your flexi-hose from time to time to ensure there are no blockages or build-up of foreign materials within the hose. You may wish to wash the hose in hot water on a weekly basis to prevent this and leave to dry overnight.

If you are experiencing any issues with any piece of your SunFX Equipment please contact us immediately
